

StrideDiffusion

Overview

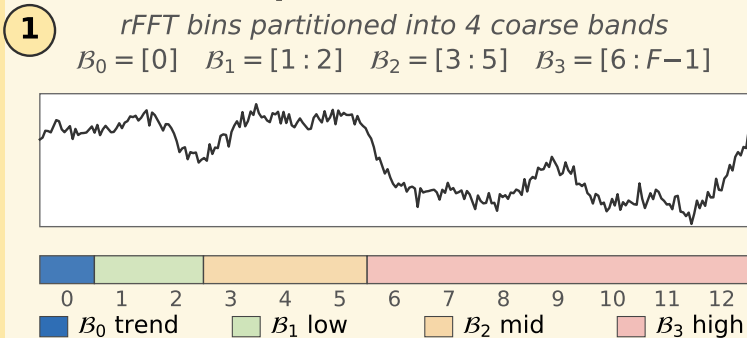

Denoising Process

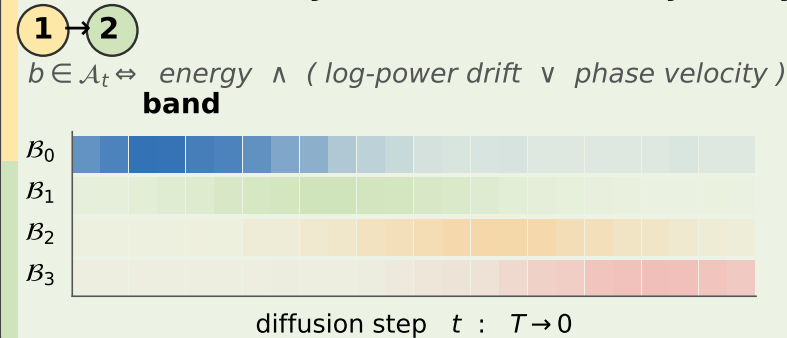

repeat until $t = 0$

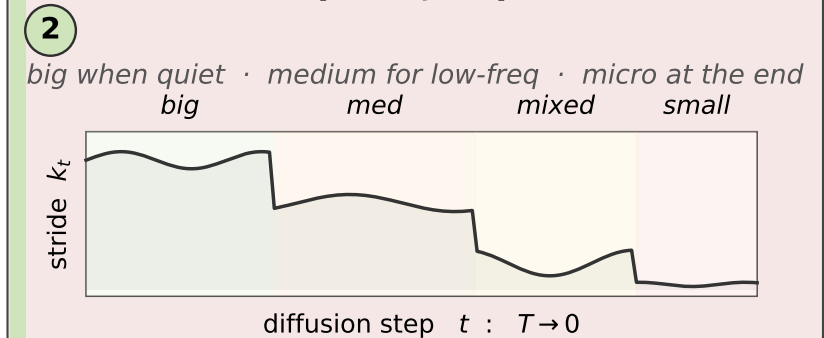

A. Temporal Band Partition

B. Band-Activity Gate over the Trajectory

C. Adaptive Jump Stride

Dynamic phase gate
 high-freq sensitivity ramps up in late sampling

Big-signal-first ($\tau_E = 0.5$)
 suppresses pseudo-active mid/high bands

2nd-order multistep
 $\sim 3 \times$ fewer NFEs at matched C-FID

Soft projection ($\gamma = 0.2$)
 avoids spectral cliffs / divergence
